

# Physics 2D Lecture Slides

## Lecture 17: Feb 8th 2005

Vivek Sharma  
UCSD Physics

### A PhD Thesis Fit For a Prince

- Matter Wave !
  - “Pilot wave” of  $\lambda = h/p = h / (\gamma mv)$
  - frequency  $f = E/h$
- Consequence:
  - If matter has wave like properties then there would be interference (destructive & constructive)
    - Use analogy of standing waves on a plucked string to explain the quantization condition of Bohr orbits

## De Broglie's Explanation of Bohr's Quantization

Standing waves in H atom:

Constructive interference when  
 $n\lambda = 2\pi r$

$$\text{since } \lambda = \frac{h}{p} = \frac{h}{mv} \quad \dots\dots(NR)$$

$$\Rightarrow \frac{nh}{mv} = 2\pi r$$

$$\Rightarrow \boxed{n\hbar = mvr}$$

Angular momentum

Quantization condition!

This is too intense ! Must verify such “loony tunes” with experiment

## Just What is Waving in Matter Waves ?

For waves in an ocean, it's the water that “waves”  
For sound waves, it's the molecules in medium  
For light it's the **E & B** vectors that oscillate

- What's “waving” for matter waves ?
  - It's the **PROBABILITY OF FINDING THE PARTICLE** that waves !
  - **Particle can be represented by a wave packet**
    - At a certain location (x)
    - At a certain time (t)
    - **Made by superposition of many sinusoidal waves of different amplitudes, wavelengths  $\lambda$  and frequency  $f$**
    - It's a “pulse” of probability in spacetime

## What Wave Does Not Describe a Particle

- What wave form can be associated with particle's pilot wave?
- A traveling sinusoidal wave?  $y = A \cos(kx - \omega t + \Phi)$
- Since de Broglie "pilot wave" represents particle, it must travel with same speed as particle .....(like me and my shadow)

Phase velocity ( $v_p$ ) of sinusoidal wave:  $v_p = \lambda f$

In Matter:

$$(a) \lambda = \frac{h}{p} = \frac{h}{\gamma m v}$$

$$(b) f = \frac{E}{h} = \frac{\gamma m c^2}{h}$$

$$\Rightarrow v_p = \lambda f = \frac{E}{p} = \frac{\gamma m c^2}{\gamma m v} = \frac{c^2}{v} > c!$$

Conflicts with  
Relativity →  
Unphysical

Single sinusoidal wave of infinite extent does not represent particle localized in space

Need "wave packets" localized Spatially (x) and Temporally (t)

## Wave Group or Wave Pulse

- Wave Group/packet:
  - Superposition of many sinusoidal waves with different wavelengths and frequencies
  - Localized in space, time
  - Size designated by
    - $\Delta x$  or  $\Delta t$
  - Wave groups travel with the speed  $v_g = v_o$  of particle
- Constructing Wave Packets
  - Add waves of diff  $\lambda$ ,
  - For each wave, pick
    - Amplitude
    - Phase
  - Constructive interference over the space-time of particle
  - Destructive interference elsewhere !

Imagine Wave pulse moving along a string: its localized in time and space (unlike a pure harmonic wave)

Wave packet represents particle prob

## How To Make Wave Packets : Just Beat it !

- Superposition of two sound waves of slightly different frequencies  $f_1$  and  $f_2$ ,  $f_1 \cong f_2$
- Pattern of beats is a series of wave packets
- Beat frequency  $f_{\text{beat}} = f_2 - f_1 = \Delta f$
- $\Delta f$  = range of frequencies that are superimposed to form the wave packet

Resulting wave's "displacement"  $y = y_1 + y_2$  :

$$y = A [\cos(k_1 x - \omega_1 t) + \cos(k_2 x - \omega_2 t)]$$

Addition of 2 Waves with slightly different wavelengths and slightly different frequencies

Trigonometry :  $\cos A + \cos B = 2 \cos\left(\frac{A+B}{2}\right) \cos\left(\frac{A-B}{2}\right)$

$$\therefore y = 2A \left[ \cos\left(\frac{k_2 - k_1}{2} x - \frac{\omega_2 - \omega_1}{2} t\right) \cos\left(\frac{k_2 + k_1}{2} x - \frac{\omega_2 + \omega_1}{2} t\right) \right]$$

since  $k_2 \cong k_1 \cong k_{\text{ave}}$ ,  $\omega_2 \cong \omega_1 \cong \omega_{\text{ave}}$ ,  $\Delta k \ll k$ ,  $\Delta \omega \ll \omega$

$$\therefore y = 2A \left[ \cos\left(\frac{\Delta k}{2} x - \frac{\Delta \omega}{2} t\right) \cos(kx - \omega t) \right] \equiv y = A' \cos(kx - \omega t), \text{ } A' \text{ oscillates in } x, t$$

$$A' = 2A \cos\left(\frac{\Delta k}{2} x - \frac{\Delta \omega}{2} t\right) = \text{modulated amplitude}$$

**Non-repeating wave packet can be created thru superposition  
Of many waves of similar (but different) frequencies and wavelengths**

**Wave Packet : Localization**

- Finite # of diff. Monochromatic waves always produce INFINITE sequence of repeating wave groups → can't describe (localized) particle
- To make localized wave packet, add "infinite" # of waves with Well chosen Ampl A, Wave# k, ang.

$$\psi(x, t) = \int_{-\infty}^{\infty} A(k) e^{i(kx - \omega t)} dk$$

$A(k)$  = Amplitude Fn  
 ⇒ diff waves of diff k  
 have different amplitudes  $A(k)$   
 $\omega = \omega(k)$ , depends on type of wave, media  
 Group Velocity  $V_g = \left. \frac{d\omega}{dk} \right|_{k=k_0}$

## Group, Velocity, Phase Velocity and Dispersion

In a Wave Packet:  $w = w(k)$

$$\text{Group Velocity } V_g = \left. \frac{dw}{dk} \right|_{k=k_0}$$

Since  $V_p = \omega/k$  (def)  $\Rightarrow w = kV_p$

$$\therefore \left. \frac{dw}{dk} \right|_{k=k_0} = \left. V_p \right|_{k=k_0} + k \left. \frac{dV_p}{dk} \right|_{k=k_0}$$

usually  $V_g = V_p(k \text{ or } \lambda)$

Material in which  $V_p$  varies with  $\lambda$  are said to be Dispersive

Individual harmonic waves making a wave pulse travel at different  $V_p$  thus changing shape of pulse and become spread out

Ins laser pulse disperse  
By x30 after travelling  
1km in optical fiber

In non-dispersive media,  $V_g = V_p$

In dispersive media  $V_g \neq V_p$ , depends on  $\frac{dV_p}{dk}$

## Group Velocity of Wave Packets: $v_g$

Consider An Electron:

mass = m velocity = v, momentum = p

Energy  $E = hf = \gamma mc^2$ ;  $\omega = 2\pi f = \frac{2\pi}{h} \gamma mc^2$

Wavelength  $\lambda = \frac{h}{p}$ ;  $k = \frac{2\pi}{\lambda} \Rightarrow k = \frac{2\pi}{h} \gamma mv$

Group Velocity:  $V_g = \frac{dw}{dk} = \frac{dw/dv}{dk/dv}$

$$\frac{dw}{dv} = \frac{d}{dv} \left[ \frac{2\pi}{h} \frac{mc^2}{[1-(\frac{v}{c})^2]^{1/2}} \right] = \frac{2\pi mv}{h[1-(\frac{v}{c})^2]^{3/2}} \quad \& \quad \frac{dk}{dv} = \frac{d}{dv} \left[ \frac{2\pi}{h[1-(\frac{v}{c})^2]^{1/2}} mv \right] = \frac{2\pi m}{h[1-(\frac{v}{c})^2]^{3/2}}$$

$$V_g = \frac{dw}{dk} = \frac{dw/dv}{dk/dv} = v \Rightarrow \text{Group velocity of electron Wave packet "pilot wave"}$$

is same as electron's physical velocity

But velocity of individual waves making up the wave packet  $V_p = \frac{w}{k} = \frac{c^2}{v} > c!$  (not physical)

## Wave Packets & Uncertainty Principles

We added two Sinusoidal waves

$$y = 2A \left[ \cos\left(\frac{\Delta k}{2}x - \frac{\Delta \omega}{2}t\right) \cos(kx - \omega t) \right]$$

Amplitude Modulation

- Distance  $\Delta X$  between adjacent minima =  $(X_2)_{\text{node}} - (X_1)_{\text{node}}$
- Define  $X_1=0$  then phase diff from  $X_1 \rightarrow X_2 = \pi$  (similarly for  $t_1 \rightarrow t_2$ )

What can we learn from this simple model?

Node at  $y = 0 = 2A \cos\left(\frac{\Delta \omega}{2}t - \frac{\Delta k}{2}x\right)$ , Examine  $x$  or  $t$  behavior

$\Rightarrow$  in  $x$ :  $|\Delta k \cdot \Delta x = \pi| \Rightarrow$  Need to combine many waves of diff.  $k$  to make small  $\Delta x$  pulse

$\Delta x = \frac{\pi}{\Delta k}$ , for small  $\Delta x \rightarrow 0 \Rightarrow \Delta k \rightarrow \infty$  & Vice Verca

and In  $t$ :  $|\Delta \omega \cdot \Delta t = \pi| \Rightarrow$  Need to combine many waves of diff  $\omega$  to make small  $\Delta t$  pulse

$\Delta t = \frac{\pi}{\Delta \omega}$ , for small  $\Delta t \rightarrow 0 \Rightarrow \Delta \omega \rightarrow \infty$  & Vice Verca

## Signal Transmission and Bandwidth Theory

- Short duration pulses are used to transmit digital info
  - Over phone line as brief tone pulses
  - Over satellite link as brief radio pulses
  - Over optical fiber as brief laser light pulses
- Regardless of type of wave or medium, any wave pulse must obey the fundamental relation

$$\gg \Delta \omega \Delta t \cong \pi$$

- Range of frequencies that can be transmitted are called bandwidth of the medium
- Shortest possible pulse that can be transmitted thru a medium is  $\Delta t_{\text{min}} \cong \pi / \Delta \omega$
- Higher bandwidths transmits shorter pulses & allows high data rate

## Wave Packets & Uncertainty Principles of Subatomic Physics

in space  $x$ :  $\Delta k \cdot \Delta x = \pi \Rightarrow$  since  $k = \frac{2\pi}{\lambda}$ ,  $p = \frac{h}{\lambda}$

$$\Rightarrow \Delta p \cdot \Delta x = h/2$$

usually one writes  $\Delta p \cdot \Delta x \geq \hbar/2$  approximate relation

In time  $t$ :  $\Delta \omega \cdot \Delta t = \pi \Rightarrow$  since  $\omega = 2\pi f$ ,  $E = hf$

$$\Rightarrow \Delta E \cdot \Delta t = h/2$$

usually one writes  $\Delta E \cdot \Delta t \geq \hbar/2$  approximate relation

What do these inequalities mean physically?

## Know the Error of Thy Ways: Measurement Error $\rightarrow \Delta$

- Measurements are made by observing something : length, time, momentum, energy
- All measurements have some (limited) precision`...no matter the instrument used
- Examples:
  - How long is a desk ?  $L = (5 \pm 0.1) \text{ m} = L \pm \Delta L$  (depends on ruler used)
  - How long was this lecture ?  $T = (50 \pm 1) \text{ minutes} = T \pm \Delta T$  (depends on the accuracy of your watch)
  - How much does Prof. Sharma weigh ?  $M = (1000 \pm 700) \text{ kg} = m \pm \Delta m$ 
    - Is this a correct measure of my weight ?
      - Correct (because of large error reported) but imprecise
      - My correct weight is covered by the (large) error in observation

Best Estimate Length: 36 mm  
Probable Range: 35.5 to 36.5 mm

Length Measure

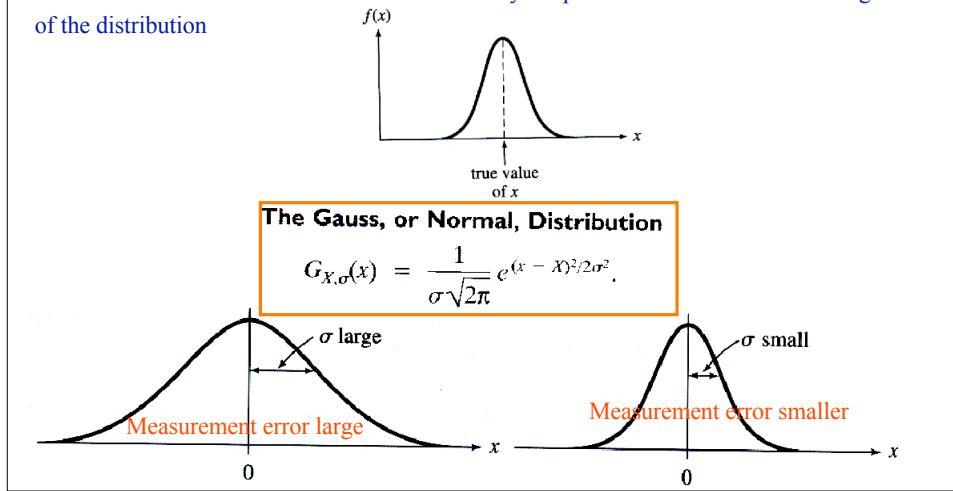

Best Estimate of Voltage: 5.3 V  
Estimated Range: 5.2 to 5.4 mm

Voltage (or time) Measure

## Measurement Error : $x \pm \Delta x$

- Measurement errors are unavoidable since the measurement procedure is an experimental one
- True value of an measurable quantity is an abstract concept
- In a set of repeated measurements with random errors, the distribution of measurements resembles a Gaussian distribution characterized by the parameter  $\sigma$  or  $\Delta$  characterizing the width of the distribution

## Interpreting Measurements with random Error : $\Delta$

**Figure 5.12.** The shaded area between  $X \pm t\sigma$  is the probability of a measurement within  $t$  standard deviations of  $X$ .

$t$	0	0.25	0.5	0.75	1.0	1.25	1.5	1.75	2.0	2.5	3.0	3.5	4.0
Prob (%)	0	20	38	55	68	79	87	92	95.4	98.8	99.7	99.95	99.99

## Where in the World is Carmen San Diego?

- Carmen San Diego hidden inside a big box of length  $L$
- Suppose you can't see thru the (blue) box, what is your best estimate of her location inside box (she could be anywhere inside the box)

Your best unbiased measure would be  $x = L/2 \pm L/2$

There is no perfect measurement, there are always measurement error

## Wave Packets & Matter Waves

What is the Wave Length of this wave packet?

$$\lambda - \Delta\lambda < \lambda < \lambda + \Delta\lambda$$

De Broglie wavelength  $\lambda = h/p$

→ Momentum Uncertainty:  $p - \Delta p < p < p + \Delta p$

Similarly for frequency  $\omega$  or  $f$

$$\omega - \Delta\omega < \omega < \omega + \Delta\omega$$

Planck's condition  $E = hf = h\omega/2$

→  $E - \Delta E < E < E + \Delta E$

## Back to Heisenberg's Uncertainty Principle & $\Delta$

- $\Delta x, \Delta p \geq h/4\pi \Rightarrow$

- If the measurement of the position of a particle is made with a precision  $\Delta x$  and a SIMULTANEOUS measurement of its momentum  $p_x$  in the X direction, then the product of the two uncertainties (measurement errors) can never be smaller than  $\cong h/4\pi$  irrespective of how precise the measurement tools

- $\Delta E, \Delta t \geq h/4\pi \Rightarrow$

- If the measurement of the energy E of a particle is made with a precision  $\Delta E$  and it took time  $\Delta t$  to make that measurement, then the product of the two uncertainties (measurement errors) can never be smaller than  $\cong h/4\pi$  irrespective of how precise the measurement tools

These rules arise from the way we constructed the Wave packets describing Matter “pilot” waves

Perhaps these rules  
Are bogus, can we verify  
this with some physical  
picture ??

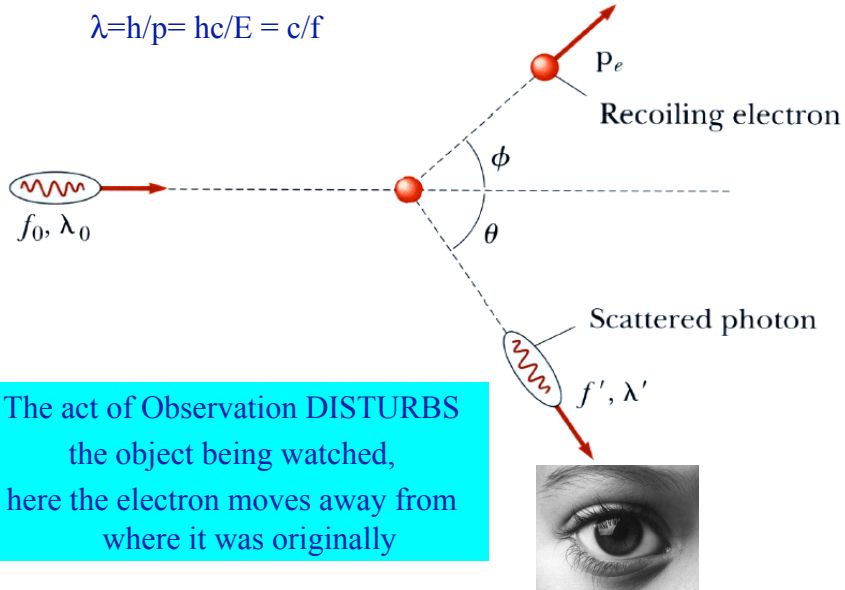

## The Act of Observation (Compton Scattering)

Observations of particle motion by means of scattered illumination. When the incident wavelength is reduced to accommodate the size of the particle, the momentum transferred by the photon becomes large enough to disturb the observed motion.

## Compton Scattering: Shining light to observe electron

$$\lambda = h/p = hc/E = c/f$$

The act of Observation **DISTURBS** the object being watched, here the electron moves away from where it was originally

## Act of Watching: A Thought Experiment

## Diffraction By a Circular Aperture (Lens)

See Resnick, Halliday Walker 6<sup>th</sup> Ed (on S.Reserve), Ch 37, pages 898-900

Fig. 37-9 The diffraction pattern of a circular aperture. Note the central maximum and the circular secondary maxima. The figure has been overexposed to bring out these secondary maxima, which are much less intense than the central maximum.

Diffraction image of a point source of light thru a lens ( circular aperture of size  $d$  )

First minimum of diffraction pattern is located by

$$\sin \theta = 1.22 \frac{\lambda}{d}$$

See previous picture for definitions of  $\vartheta, \lambda, d$

## Resolving Power of Light Thru a Lens

Image of 2 separate point sources formed by a converging lens of diameter  $d$ , ability to resolve them depends on  $\lambda$  &  $d$  because of the Inherent diffraction in image formation

$$\text{Resolving power } \Delta x \approx \frac{\lambda}{2 \sin \theta}$$

$\vartheta$  Depends on  $d$

## Putting it all together: act of Observing an electron

- Incident light ( $p, \lambda$ ) scatters off electron
- To be collected by lens  $\rightarrow \gamma$  must scatter thru angle  $\alpha$ 
  - $-\vartheta \leq \alpha \leq \vartheta$

- Due to Compton scatter, electron picks up momentum

•  $P_x, P_y$

$$-\frac{h}{\lambda} \sin \theta \leq P_x \leq \frac{h}{\lambda} \sin \theta$$

electron momentum uncertainty is

$$\Delta p \equiv \frac{\sim 2h}{\lambda} \sin \theta$$

- After passing thru lens, photon diffracts, lands somewhere on screen, image (of electron) is fuzzy
- How fuzzy? Optics says shortest distance between two resolvable points is:

$$\Delta x = \frac{\lambda}{2 \sin \theta}$$

- Larger the lens radius, larger the  $\vartheta \Rightarrow$  better resolution

$$\Rightarrow \Delta p \Delta x = \left( \frac{2h \sin \theta}{\lambda} \right) \left( \frac{\lambda}{2 \sin \theta} \right) = h$$

$$\Rightarrow \Delta p \Delta x \geq h/2$$

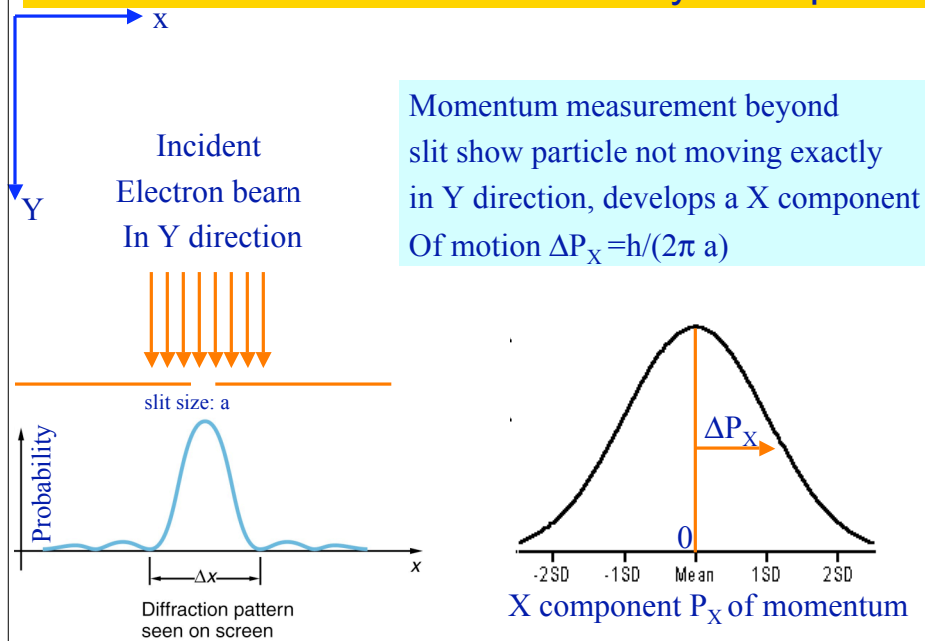

## Pseudo-Philosophical Aftermath of Uncertainty Principle

- Newtonian Physics & Deterministic physics topples over
    - Newton's laws told you all you needed to know about trajectory of a particle
      - Apply a force, watch the particle go !
        - Know every thing !  $X, v, p, F, a$
        - Can predict **exact** trajectory of particle if you had perfect device
  - No so in the subatomic world !
    - Of small momenta, forces, energies
    - Cant predict anything exactly
      - Can only predict probabilities
        - There is so much chance that the particle landed here or there
        - Cant be sure !...cognizant of the errors of thy observations
- Philosophers went nuts !...what has happened to nature
- Philosophers just talk, don't do real life experiments!

## All Measurements Have Associated Errors

- If your measuring apparatus has an intrinsic inaccuracy (error) of amount  $\Delta p$
- Then results of measurement of momentum  $p$  of an object **at rest** can easily yield a range of values accommodated by the measurement imprecision :
  - $-\Delta p \leq p \leq \Delta p$
- Similarly for all measurable quantities like  $x$ ,  $t$ , Energy !

## Matter Diffraction & Uncertainty Principle

## Particle at Rest Between Two Walls

- Object of mass  $M$  at rest between two walls originally at infinity
- What happens to our perception of George as the walls are brought in?

On average, measure  $\langle p \rangle = 0$   
but there are quite large fluctuations!  
Width of Distribution =  $\Delta P$

$$\Delta P = \sqrt{\langle P^2 \rangle_{ave} - \langle P_{ave} \rangle^2}; \quad \Delta P \sim \frac{\hbar}{L}$$
